Varieties may change during the season and will be substituted by similar available varieties.

Other Mixtures Available:

TIPPERARY GRASS TRADITIONAL HAY MEADOW

A mixture which is formulated to reflect an old hay meadow.

TIPPERARY GRASS HORSE GRAZING

An equine mixture formulated to cater for diverse needs providing nutritious, persistent and palatable pastures.

Forage Crops

RAPE

Forage Rape is an excellent break crop between grass and leys. It has the ability to survive on relatively poor soils and can be ready to utilise between 13-15 weeks from sowing.

Sowing rate: 6 - 10kg/ha (May to September)

KALE

Kale is being grown increasingly on Irish dairy farms, for feeding dry cows and younger stock. Kale produces high yields of quality feed that can be grazed in-situ. Early sown crops which establish well are most likely to give highest yields.

Sowing rate: 2.5 - 5kg/ha (April to mid July)

HYBRID RAPE/KALE

A Kale Rape Hybrid, this is a fodder crop that provides rapid growth ability and good all year round performance. It is mainly used as a high energy, high protein graze for cattle and sheep and ideal for out-wintering systems.
